✓	<u>php_sockets</u>
	php_sqlite
	php_sqlite3
	php_sybase_ct
	php_tidy
	php_xmlrpc
	php_xsl
	php_zip

Gmail considerations

If you use your personal Gmail account to send emails from your website exists the possibility of an authentication error even though you specified your Gmail username and password correctly.

This is because Gmail detects that previously you did not send emails from your web site direction before, just login in your Gmail account and instruct Gmail that you recognize this activity.
